Loading and Performance — Typical Mission

C O N D I T I O N S			BASIC MISSION	TRAINER RADIUS
			I	II
TAKE-OFF WEIGHT		(lb)	181,440	143,000
Fuel at 6.8 lb/gal (grade JP-1)		(lb)	86,800	61,200
Military load (Bombs)		(lb)	10,000	None
Wing loading		(lb/sq ft)	127.1	100.2
Stall speed (power off, landing configuration)		(kn)	137.0	121.0
Take-off ground run at SL	①	(ft)	9400	5200
Take-off ground run with ATO	① ⑤	(ft)	7500	—
Take-off to clear 50 ft	①	(ft)	10,820	6340
Take-off to clear 50 ft with ATO	① ⑤	(ft)	8860	—
Rate of climb at SL	②	(fpm)	2650	3650
Time: SL to 25,000 ft	②	(min)	14.0	9.6
Time: SL to 30,000 ft	②	(min)	20.0	17.7 ⑧
Service ceiling (100 fpm)	②	(ft)	33,500	38,450
Service ceiling (one engine out)		(ft)	⑥	⑥
COMBAT RANGE	③	(n. mi.)	3360	⑥
Average speed		(kn)	431	⑥
Initial cruising altitude		(ft)	30,500	⑥
Final cruising altitude		(ft)	44,800	⑥
Total mission time		(hr)	8.0	⑥
COMBAT RADIUS	③	(n. mi.)	1750	1230
Average speed		(kn)	431	431
Initial cruising altitude		(ft)	30,500	35,500
Bombing altitude		(ft)	39,400	—
Bomb run speed	②	(kn)	446	—
Final cruising altitude		(ft)	44,500	44,500
Total mission time		(hr)	8.3	5.9
COMBAT WEIGHT	④	(lb)	121,800	113,000
Combat altitude		(ft)	35,000	42,500
Combat speed	①	(kn)	486	461
Combat climb	①	(fpm)	1500	500
Combat ceiling (500 fpm)	①	(ft)	41,500	43,000
Service ceiling (100 fpm)	①	(ft)	43,000	44,000
Service ceiling (one engine out)		(ft)	⑥	⑥
Max rate of climb at SL	①	(fpm)	5200	6100
Max speed at 10,800 ft	①	(kn)	537	537
LANDING WEIGHT		(lb)	91,844	87,920
Ground roll at SL		(ft)	⑦	⑥
Ground roll (auxiliary brake)	⑧	(ft)	5400	⑥
Total from 50 ft	⑧	(ft)	⑥	⑥
Total from 50 ft (auxiliary brake)		(ft)	6520	⑥

N O T E S

① Max power shown.	⑤ ATO used in take-off (18,000 lb thrust)	(See page 6, note d)
② Normal power	⑥ Not available	PERFORMANCE BASIS:
③ Detailed descriptions of RADIUS & RANGE missions are given on page 6.	⑦ Climb to 35,500 ft	(a) Data source: Contractor's estimates
④ For Radius Mission if Radius is	⑧ With 32 ft ribbon braking parachute	(b) Performance is based on powers shown on page 6.

N O T E SFORMULA: RADIUS MISSION I

Take-off climb on course to 30,500 ft. altitude at normal power cruise out at long range speeds increasing altitude with decreasing airplane weight, make 6 minute normal power bomb-run to target, drop bombs, conduct normal power evasive action for 6 minutes, start cruise to home base at 41,000 ft. altitude arriving over home base at 44,500 ft. altitude. Range free allowances are: 5 minutes normal power fuel consumption for starting engines and take-off, plus 6 minutes normal power evasive action, plus 10% of initial fuel for reserve.

FORMULA: RANGE MISSION I

Same as the outbound leg of the Basic Radius formula continued without dropping the bombs until 90% of the initial fuel has been used at 44,800 ft. altitude, leaving 10% fuel reserve for combat, evasive action, landing reserve, or other considerations for which no distance credit is allowed.

FORMULA: RADIUS MISSION II

Same as the Basic Radius formula except no assist is used for take-off and no bombs are carried. Take-off weight is limited to 143,000 lb. to meet the take-off requirement of 7,500 ft. over a 50 ft obstacle on an Army hot day. Initial altitude for start of cruise out is 35,000 ft. and final altitude over the home base is 44,500 ft. Range free allowances are the same as for the Basic Radius formula.

GENERAL DATA:

- (a) Estimated data
- (b) Airplane performance based on test performance of engines installed in production B-47A and B-47B airplanes.

(c) Normal technique for take-off with ATO-15 second duration, rockets fired 10 seconds before take-off.

(d) Landing distances are based on 6 engines at 52% (4200 RPM) for approach and 2 inboard engines at 52% RPM for ground roll. Brakes applied at 40 knots.

(e) Times to climb do not include take-off time and time to accelerate to best climb speed.

(f) Max. landing weight 180,000 lb. limited by max flight weight without external fuel (computed on basis of 8 ft/sec. ultimate rate of descent with 1G wing lift.)

(g) Engine ratings shown on page 3 are engine manufacturer's guaranteed ratings. Power values used for performance calculations are:

J47-GE-11			
S. L. Static	LB	RPM	MIN.
Max:	5420	7950	5
Nor:	5030	7640	Cont.
Note: Above values from G. E. letter dated 16 May 1950.			

(h) Limited by strength to 185,000 lb which includes 5000 lb ATO oxidizer for liquid rockets pending availability. (Liquid rockets utilize normal aircraft fuel in conjunction with the oxidizers).

(i) JP-3 is primary fuel, JP-1 is alternate grade used to show performance data.

SUPPLEMENTAL

The data herein is to present the radius capabilities of the B-47B when refueled from various tankers. The tankers are considered to refuel the B-47B at the optimum altitude and distance from base for the given tanker bomber combination. Only a single refuel condition is considered. A generalized profile of this mission is shown below.

WHERE: "A" is distance to refuel point
 "B" is total mission radius
 "C" is altitude of refuel

Distance "A" and altitude "C" for various tankers may be determined from table 1 below. These altitudes and distances are so chosen that the tanker flies at max refuel speed (not to exceed normal rated power speed) and the bomber is capable of making good a 300 fpm rate of climb in the downwash of the tanker and does not operate at a lift coefficient of greater than $3/4 C_{L \text{ max}}$ with flaps up.

OPTIMUM
FORMATING LIMITS

TANKER MODEL	REFUEL DISTANCE "A"	REFUEL ALTITUDE "C"
KB-29P	318 N. Mi	17,000 ft
KC-97E	520 N. Mi	20,000 ft
YKC-124B	1010 N. Mi	25,000 ft

Table 1

With the distance "A" and altitude "C" for any given tanker (from table 1) enter figure 1 with "A" and move horizontally to the proper altitude "C" (interpolating where necessary) and read vertically down to obtain total mission radius.

B-47B SINGLE REFUEL RADIUS
